## 1 Task 1

### 1.1 Derivation of points positions

1. I assume that point  $O_1$  is positioned in the (0, 0).

2. We can describe the position of point A as it rotates around point  $O_1$  as follows:

$$r_{A}(t) = O_{1}A \begin{bmatrix} \cos(\phi) \\ \sin(\phi) \end{bmatrix}$$
 (1)

- 3. Position of  $O_2$  is (-c, a) as follows from task description.
- 4. We can describe the position of point B as intersection between two circles: first with center at A and radius AB and second with center at  $O_2$  and radius  $OA_2$ :

$$\begin{cases} (x_B - x_A)^2 + (y_B - y_A)^2 = AB^2\\ (x_B - x_{O_2})^2 + (y_B - y_{O_2})^2 = O_2A^2 \end{cases}$$
 (2)

These equations can be solved easily with solvers like Sympy for Python. I faced several problems with this step:

(a) Mechanism does not work for all angles of  $\phi$ . Distance between A and  $O_2$  is at maximum:

$$(O_1 A \cdot \cos(\phi) - a)^2 + (O_1 A \cdot \sin(\phi) + c)^2 = (AB + O_2 B)^2$$
 (3)

This will happen when  $O_2BA$  will form a straight line. Wolframagic solution link We get 2 angles, but actually only one is important for us, because we rotate CCW starting from  $\pi/3$ . Limit angle will be  $\approx 2.004$  radians. Thus my simulation is limited for  $\phi \in [\pi/3, 2.004]$ .

- (b) We have 2 solutions from quadratic equations and have to choose one: I select the most right and top (greatest x and y coordinates) point because it looks nicer and closer to starting position from picture. I will follow this approach for other cases too.
- 5. We can describe the position of point C as intersection between two circles: first with center at B and radius BC and second with center at A and radius AB:

$$\begin{cases} (x_C - x_B)^2 + (y_C - y_B)^2 = BC^2\\ (x_C - x_A)^2 + (y_C - y_A)^2 = AB^2 \end{cases}$$
(4)

6. We can describe the position of point D as intersection between circle (center C radius CD) and a line because point D has only translational motion on the fixed axis:

$$\begin{cases} (x_D - x_C)^2 + (y_D - y_C)^2 = CD^2 \\ y_D = d \end{cases}$$
 (5)

7. Point E is on CD segment and can be found as follows:

$$\vec{r_E(t)} = \vec{r_C(t)} + \frac{\vec{r_D(t)} - \vec{r_C(t)}}{CD}CE$$
 (6)

8. Point F can be found as intersection of two circles: one with center E and radius EF and second with center  $O_3$  and radius  $O_3F$ :

$$\begin{cases} (x_F - x_E)^2 + (y_F - y_E)^2 = EF^2\\ (x_F - x_{O_3})^2 + (y_F - y_{O_3})^2 = O_3F^2 \end{cases}$$
 (7)

#### 1.2 Derivation of velocities for points

 $\mathrm{meme}\ \mathrm{link}$ 

1. Velocity of point A:

$$\vec{v_A(t)} = \vec{r_A(t)} = \omega \cdot \vec{r_A(t)} \tag{8}$$

2. Velocity of point B can be found as follows:

$$\vec{v_B}(t) = \dot{\vec{r_B}}(t) \tag{9}$$

3. Velocity of point C can be found as follows:

$$\vec{v_C}(t) = \dot{\vec{r_C}}(t) \tag{10}$$

4. Velocity of point D can be found as follows:

$$\vec{v_D}(t) = \dot{\vec{r_D}}(t) \tag{11}$$

5. Velocity of point E can be found as follows:

$$\vec{v_E}(t) = \dot{\vec{r_E}}(t) \tag{12}$$

6. Velocity of point F can be found as follows:

$$\vec{v_F}(t) = \dot{\vec{r_F}}(t) \tag{13}$$

#### 1.3 Derivation of angular velocities

Let's start with meme:

- 1. We could use IC(instanteneous centre of zero velocity to simplify our calculations, but I will not do it because we already have all velocities and positions of points and it is enough.
- 2. For angular velocities we can use this formula:

$$\vec{v_1}(t) = \vec{v_2}(t) + \vec{\omega}(t) \times \vec{r_{12}}(t)$$
 (14)

- 3. Angular velocity of  $O_1A$ :
  - (a)  $O_1A$  is a fixed point and we know from description that  $\omega = 2$ .
  - (b) But nevertheless:

$$\vec{v_A}(t) = \vec{v_{O_1}}(t) + \vec{\omega_{O_1}}_A(t) \times \vec{r_{O_1}}_A(t)$$
 (15)

$$\omega_{O_1A} = \frac{|\vec{v_A}(t) - \vec{v_{O_1}}(t)|}{|\vec{r_{O_1A}}(t)|} \tag{16}$$

- (c) In simulation I compute both variants, and they almost equal with respect to precision of simulation and derivative computation algorithm (I use the easiest).
- 4. As all formulas are pretty much the same I will not comment others.
- 5. Angular velocity of  $O_2B$ :

$$\vec{v_B}(t) = \vec{v_{O_2}}(t) + \omega_{O_2B}(t) \times \vec{r_{O_2B}}(t)$$
 (17)

$$\omega_{O_2B} = \frac{|\vec{v_B}(t) - \vec{v_{O_2}}(t)|}{|\vec{r_{O_2}}B(t)|} \tag{18}$$

6. Angular velocity of AB:

$$\vec{v_B}(t) = \vec{v_A}(t) + \vec{\omega_{AB}}(t) \times \vec{r_{AB}}(t) \tag{19}$$

$$\omega_{AB} = \frac{|\vec{v_B}(t) - \vec{v_A}(t)|}{|\vec{r_{AB}}(t)|} \tag{20}$$

7. Angular velocity of BC and AC: As ABC form a fixed triangle, their angular velocities are equal:

$$\omega_{AB} = \omega_{BC} = \omega_{AC} \tag{21}$$

But in order to justify and prove it to myself I also compute them separately:

$$\vec{v_C}(t) = \vec{v_B}(t) + \omega_{BC}(t) \times r_{BC}(t) \tag{22}$$

$$\omega_{BC} = \frac{|\vec{v_C}(t) - \vec{v_B}(t)|}{|\vec{r_{BC}}(t)|}$$
 (23)

$$\vec{v_C}(t) = \vec{v_A}(t) + \vec{\omega_{AC}}(t) \times \vec{r_{AC}}(t)$$
(24)

$$\omega_{AC} = \frac{|\vec{v_C}(t) - \vec{v_A}(t)|}{|\vec{r_{AC}}(t)|}$$
 (25)

8. Angular velocity of CD:

$$\vec{v_D}(t) = \vec{v_C}(t) + \vec{\omega_{CD}}(t) \times \vec{r_{CD}}(t)$$
(26)

$$\omega_{CD} = \frac{|\vec{v_D}(t) - \vec{v_C}(t)|}{|\vec{r_{CD}}(t)|}$$
 (27)

9. Angular velocities of CE and ED: CDE are on the same "body" and their angular velocities are equal:

$$\omega_{CD} = \omega_{CE} = \omega_{ED} \tag{28}$$

10. Angular velocity of EF:

$$\vec{v_F}(t) = \vec{v_E}(t) + \vec{\omega_{EF}}(t) \times \vec{r_{EF}}(t) \tag{29}$$

$$\omega_{EF} = \frac{|\vec{v_F}(t) - \vec{v_E}(t)|}{|\vec{r_{EF}}(t)|}$$
(30)

11. Angular velocitiy of  $O_3F$ :

$$\vec{v_F}(t) = \vec{v_{O_3}}(t) + \omega_{O_3F}(t) \times \vec{r_{O_3F}}(t)$$
 (31)

$$\omega_{O_3F} = \frac{|\vec{v_F}(t) - \vec{v_{O_3}}(t)|}{|\vec{r_{O_3F}}(t)|}$$
(32)

#### 1.4 Accelerations for A and B

1. Acceleration of A:

$$\vec{a_A}(t) = \dot{\vec{v_A}}(t) \tag{33}$$

We can mention that as  $\omega$  is const, there will be no tangential acceleration for A. In simulation we can see very small tangential acceleration, but it is because of precision of simulation.

2. Tangential acceleration of A:

$$\vec{a_{At}}(t) = \frac{\vec{a_A}(t) \cdot \vec{v_A}(t)}{|\vec{v_A}(t)|} \vec{r_A}(t)$$
 (34)

3. Normal acceleration of A:

$$\vec{a_{An}}(t) = \vec{a_A}(t) - \vec{a_{At}}(t) \tag{35}$$

4. Acceleration of B:

$$\vec{a_B}(t) = \dot{\vec{v_B}}(t) \tag{36}$$

5. Tangential acceleration of B:

$$\vec{a_{Bt}}(t) = \frac{\vec{a_B}(t) \cdot \vec{v_B}(t)}{|\vec{v_B}(t)|} \vec{r_B}(t)$$
 (37)

6. Normal acceleration of B:

$$\vec{a_{Bn}}(t) = \vec{a_B}(t) - \vec{a_{Bt}}(t) \tag{38}$$
